

# IT Quality and Software Test

## Lesson 9 Test Management – Incident Management V1.0

Uwe Gühl

Winter 2011/ 2012

# Contents

- Test Management – Incident Management
  - Terms
  - Defect reports
    - Rules
    - Attributes
  - Incident management
    - Bug life cycle
    - Tasks

# Definitions of Terms

- Incident [ISTQB11 – after IEEE 1008]
  - Synonym: Deviation
  - Any event occurring that requires investigation

# Definitions of Terms

- An incident must be investigated and may turn out to be a defect.

## Hint:

In practice typically we talk about “defects”, and “defect management”. ISTQB typically uses the terms “incident”, and “incident management”.

**Defect Report**

# Definitions of Terms

- Defect [ISTQB11]
  - Synonyms: Bug, fault, problem
  - A flaw in a component or system that can cause the component or system to fail to perform its required function, e.g. an incorrect statement or data definition.  
A defect, if encountered during execution, may cause a failure of the component or system.

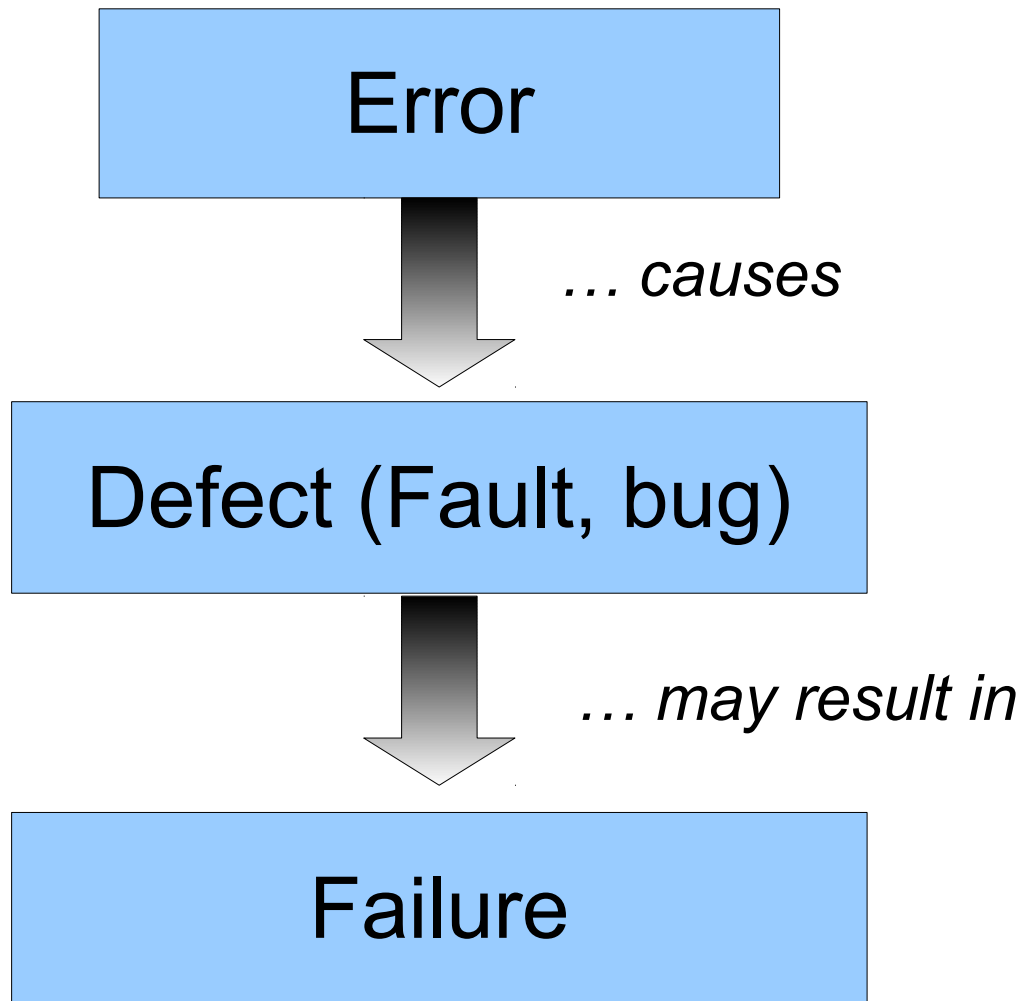

# Definitions of Terms

- Defect – More definitions:
  - Something Is Definitely Wrong With The Product [KBP01]
  - An error in construction of a product or service that renders it unusable; an error that causes a product or service to not meet requirements. [QAT11]
  - In Wikipedia “*Defect*” refers to “*Software bug*”, a failure of computer software to meet requirements.

A “*software bug*” is the common term used to describe an error, flaw, mistake, failure, or fault in a computer program or system that produces an incorrect or unexpected result, or causes it to behave in unintended ways [Wik12].

# Definitions of Terms

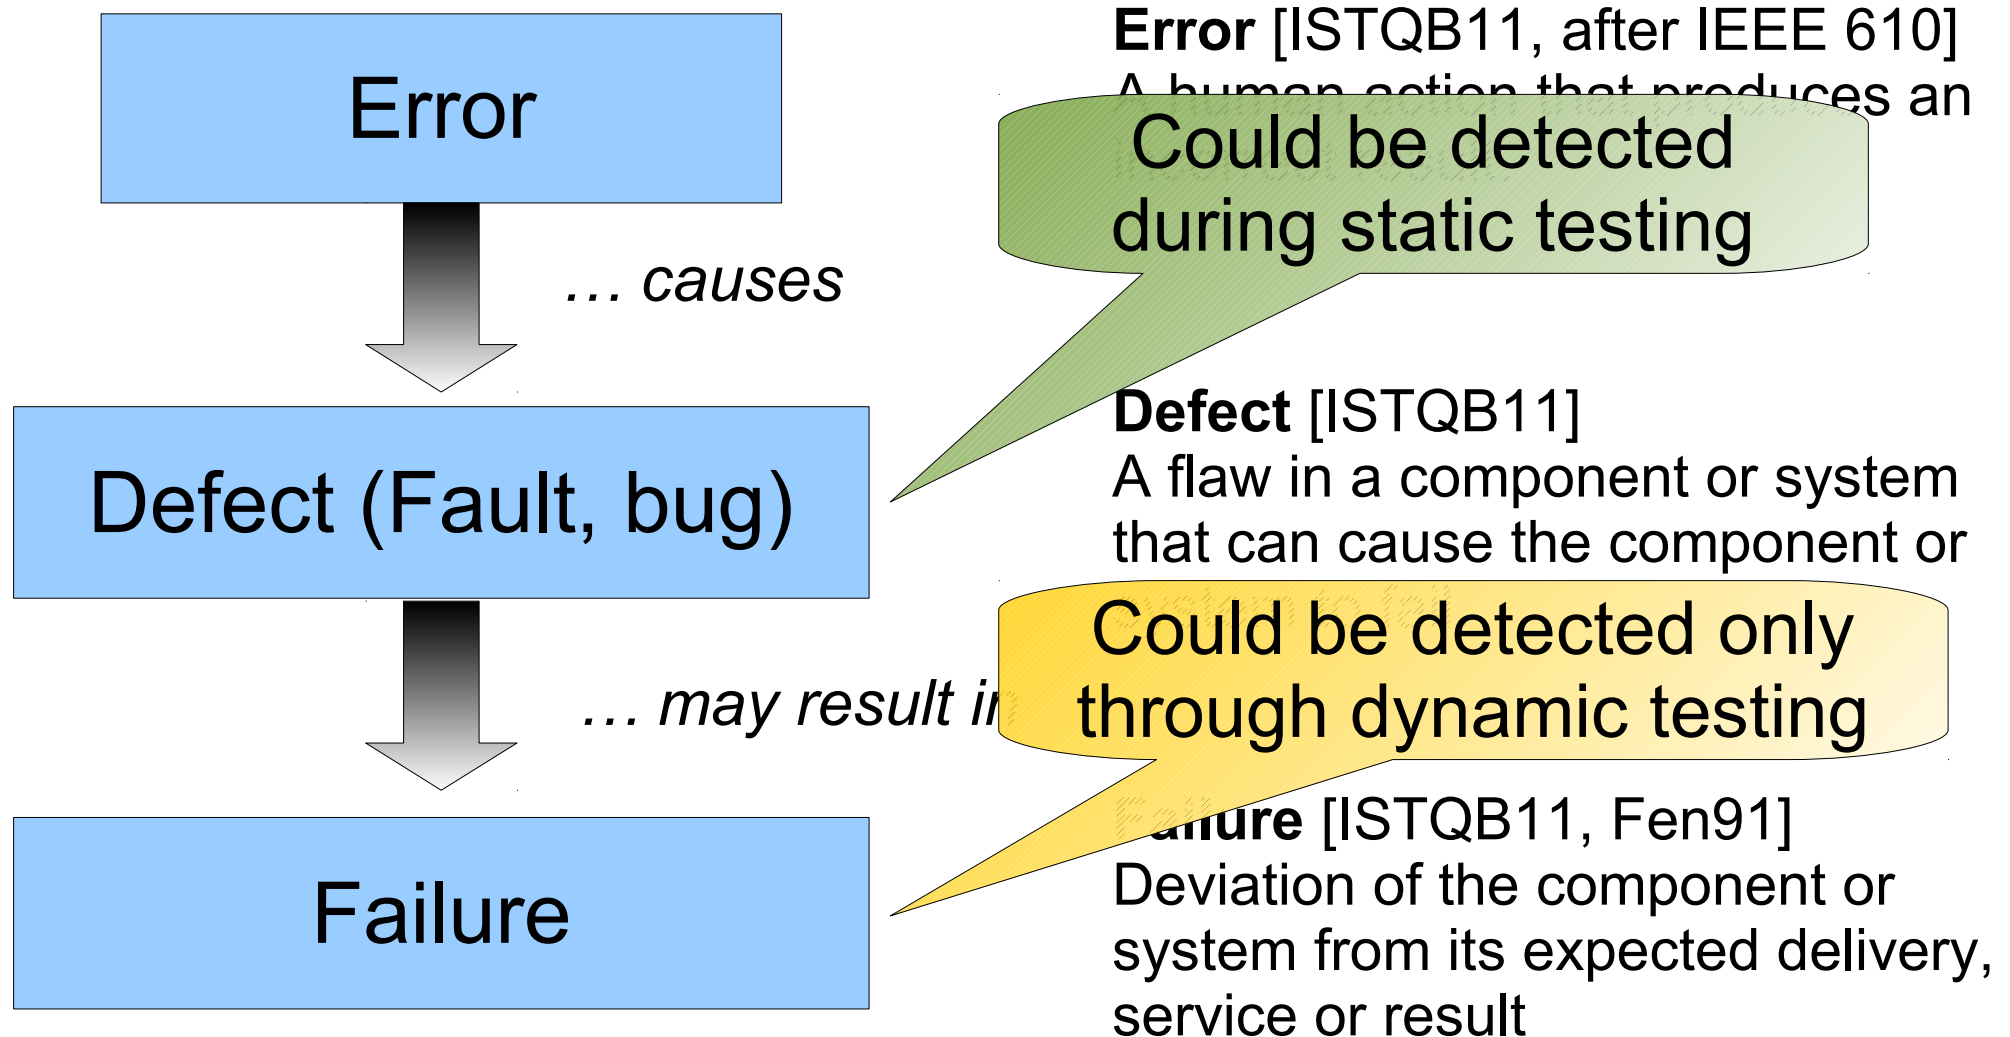

**Error** [ISTQB11, after IEEE 610]  
A human action that produces an incorrect result.

**Defect** [ISTQB11]  
A flaw in a component or system that can cause the component or system to fail.

**Failure** [ISTQB11, Fen91]  
Deviation of the component or system from its expected delivery, service or result

# Definitions of Terms

# Definitions of Terms

- Defect report [ISTQB11 after IEEE 829]
  - Synonym: Problem report, bug report.
  - A document reporting on any flaw in a component or system that can cause the component or system to fail to perform its required function.
- Incident report [ISTQB11 after IEEE 829]
  - A document reporting on any event that occurred, e.g. during the testing, which requires investigation.
  - The ‘Standard for Software Test Documentation’ [IEEE829] covers the structure of an incident report.

# Definitions of Terms

Two important attributes of a defect in a defect report describe the failure severity, and the urgency to fix it:

- Severity [ISTQB11 – after IEEE 610]
  - The degree of impact that a defect has on the development or operation of a component or system.
- Priority [ISTQB11]
  - The level of (business) importance assigned to an item, e.g. defect.

# Definitions of Terms

- Defect management [ISTQB11 – after IEEE 1044]
  - Synonym: Problem management
  - The process of recognizing, investigating, taking action and disposing of defects.  
It involves recording defects, classifying them and identifying the impact.
- Incident management [ISTQB11 – after IEEE 1044]
  - The process of recognizing, investigating, taking action and disposing of incidents.  
It involves logging incidents, classifying them and identifying the impact.

# Definitions of Terms

- Defect management tool [ISTQB11]
  - Synonym: Bug tracking tool, defect tracking tool
  - A tool that facilitates the recording and status tracking of defects and changes.  
They often have workflow-oriented facilities to track and control the allocation, correction and re-testing of defects and provide reporting facilities.
- Incident management tool [ISTQB11]
  - A tool that facilitates the recording and status tracking of incidents.  
They often have workflow-oriented facilities to track and control the allocation, correction and re-testing of incidents and provide reporting facilities.

# Defect report

- **Bad** bug reports [Tat99] are
  - reports that say nothing ("It doesn't work!");
  - reports that make no sense;
  - reports that don't give enough information;
  - reports that give wrong information;
  - reports of problems that turn out to be
    - user error;
    - the fault of somebody else's program;
    - network failures
- **Good:** Wonderfully clear, helpful, *informative* bug reports.

# Defect report

- Defect reports have the following objectives:
  - Provide developers and other parties with feedback about the problem to enable identification, isolation and correction as necessary.
  - Provide test leaders a means of tracking the quality of the system under test and the progress of the testing.
  - Provide ideas for test process improvement.

# Defect report Rules (1/3)

- Show a defect directly to the developer.
- Describe a defect so it could be reproduced.  
Best: Step by step, use screenshots
- Describe, what you expected and what you got.  
What works and what went wrong?
- Notice contents of error messages, esp. numbers
- Report the symptoms
  - **Must:** What are actual facts  
"I was at the computer and this happened".
  - **Could:** What are speculations, your ideas as proposal  
"I think the problem might be this". [Tat99]

# Defect report Rules (2/3)

- Try to work around for intermittent faults and inform about version, operating system etc.
  - Try other machines, web browsers, screen resolution
  - Does it depends on size of files you use, other programs you use parallel?
- Try to help that the defect could be fixed
  - Provide extra information on request like version numbers
  - Special activities, so that developer could locate the defect

[Tat99]

# Defect report Rules (3/3)

- Write clearly and as neutral as possible
  - *Be specific.* **Not:** "I selected Load"  
**Better:** "I clicked on Load", or "I pressed Alt-L".
  - *Be verbose.*  
If you write one sentence only, developer must ask and ask.
  - *Be careful of pronouns.*  
**Not:** "I started FooApp. It put up a warning window.  
I tried to close it and it crashed."  
**Better:** "I started FooApp, which put up a warning window.  
I tried to close the warning window, and FooApp crashed."
  - *Read what you wrote.*  
Try to reproduce a listed sequence of actions yourself.

- Don't joke

[Tat99]

# Defect report Attributes

- Details of the defect report may include:
  - Author, date of issue, issuing organization
  - Test item (configuration item)
  - Environment (Operating system, web browser, etc.)
  - Description of the defect to enable reproduction
    - Which test cases, which test steps, which test data?
    - Screenshots
    - Logs, dumps
    - Database, used files
  - Expected and actual results

# Defect report Attributes

- Details of the defect report may include:
  - Severity – of the impact on the system
    - 1 – very high: Data loss, not usable
    - ...
    - n – very low: Disfigurement
  - Priority – Urgency to fix
    - 1 – very high: Fastest fixing necessary
    - ...
    - n – very low: Subordinated handling:  
Acceptance in „open points / Proposals“
- Special status: Defect must not be fixed

# Defect report Attributes

- Details of the defect report may include:
  - Status of the defect (e.g., new, open, fixed, re-test, closed)
  - Software or system life cycle process in which the defect was observed
  - Change history, such as the sequence of actions taken by project team members with respect to the defect to isolate, repair, and confirm it as fixed
  - Conclusions, recommendations and approvals

# Defect report Attributes

- Details of the defect report may include:
  - References, including the identity of the test case specification that revealed the problem
  - Global issues, such as other areas that may be affected by a change resulting from the defect
  - Scope or degree of impact on stakeholder(s) interests

# Defect reports

- How to write reports? Example

- Step 10: enter zip code ✓
- Step 20: do not enter city name ✓
- Step 30: verify data base entry zip code ✓
- Step 40: verify data base entry city name ✗

Nullpointer exception: Window with unreadable message appears, but could be closed

Idea: A check for city name before sending the data to the server.

- Step 50: Error message displayed

Important: Your task is to report the bug in the best way so it could be fixed – Ideas for reasons and solutions are **really only optional**

# Defect reports

## Example (1/2)

**Bugzilla - Bug 8480** Printer not accessible Last modified: 2012-01-30 03:29:57

Bugzilla Life Cycle Image

The printer is not accessible, screenshot of image that cannot be printed attached.

Steps to reproduce:

- Installing printer as described in manual
- Connection between Computer and printer established
- Test print worked fine
- After starting print of an image got error message "printer not accessible"

# Incident Management

# Motivation

- One goal of testing: Finding defects
- Discrepancies between actual and expected outcomes   ⇒ Logging as incidents.  
                                      ⇒ May turn out to be a defect.
- How to handle appropriate actions?  
    ⇒ Incident management / Bug life cycle

# Incident Management

- Incident management
  - Track incidents and defects
    - from discovery and classification
    - to correction
    - to confirmation of the solution.
  - Establish an incident management process
  - Define rules for classification.

# Incident Management

When?

- Incidents may be raised during
  - development,
  - review,
  - testing or
  - use of a software product.

# Incident Management

Concerning what?

- Incidents may be raised for
  - issues in code or the working system, or
  - any type of documentation including
    - requirements,
    - development documents,
    - test documents,
    - user information such as “Help”
    - installation guides.

# Incident Management

What are possible root causes?

- Distinguish
  - Specification fault (wrong requirements)
  - Software defect
  - Environment failure
  - Interface defect
  - Error in the Test Case (Test Scenario)
  - Error in test data

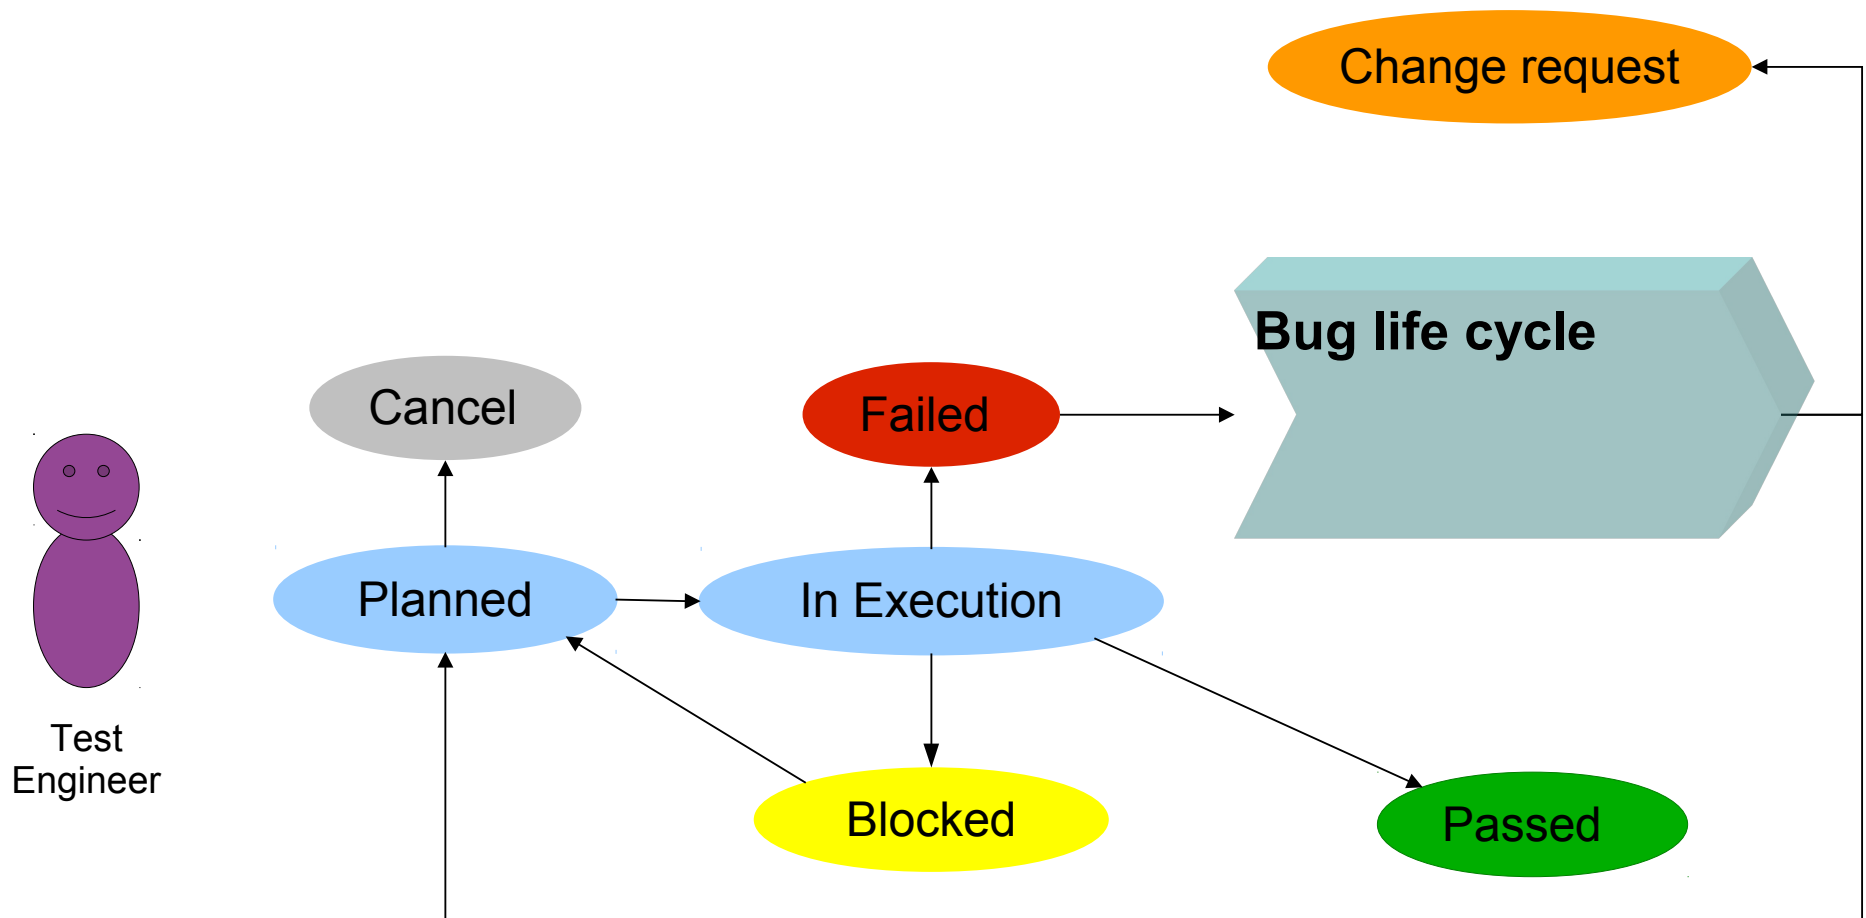

# Incident Management

- Defects and Test Cases
  - Relation is  $m:n$
  - A Test Case could have several defects  
*(Hint: That's why design small Test Cases)*
  - Problem: If an execution of a Test Case has to be stopped, possible defects in the following test steps could only be detected, after the defect is fixed and could be retested.
  - A defect could block other Test Cases  
Example: Interface tests

# Incident Management Bug life cycle

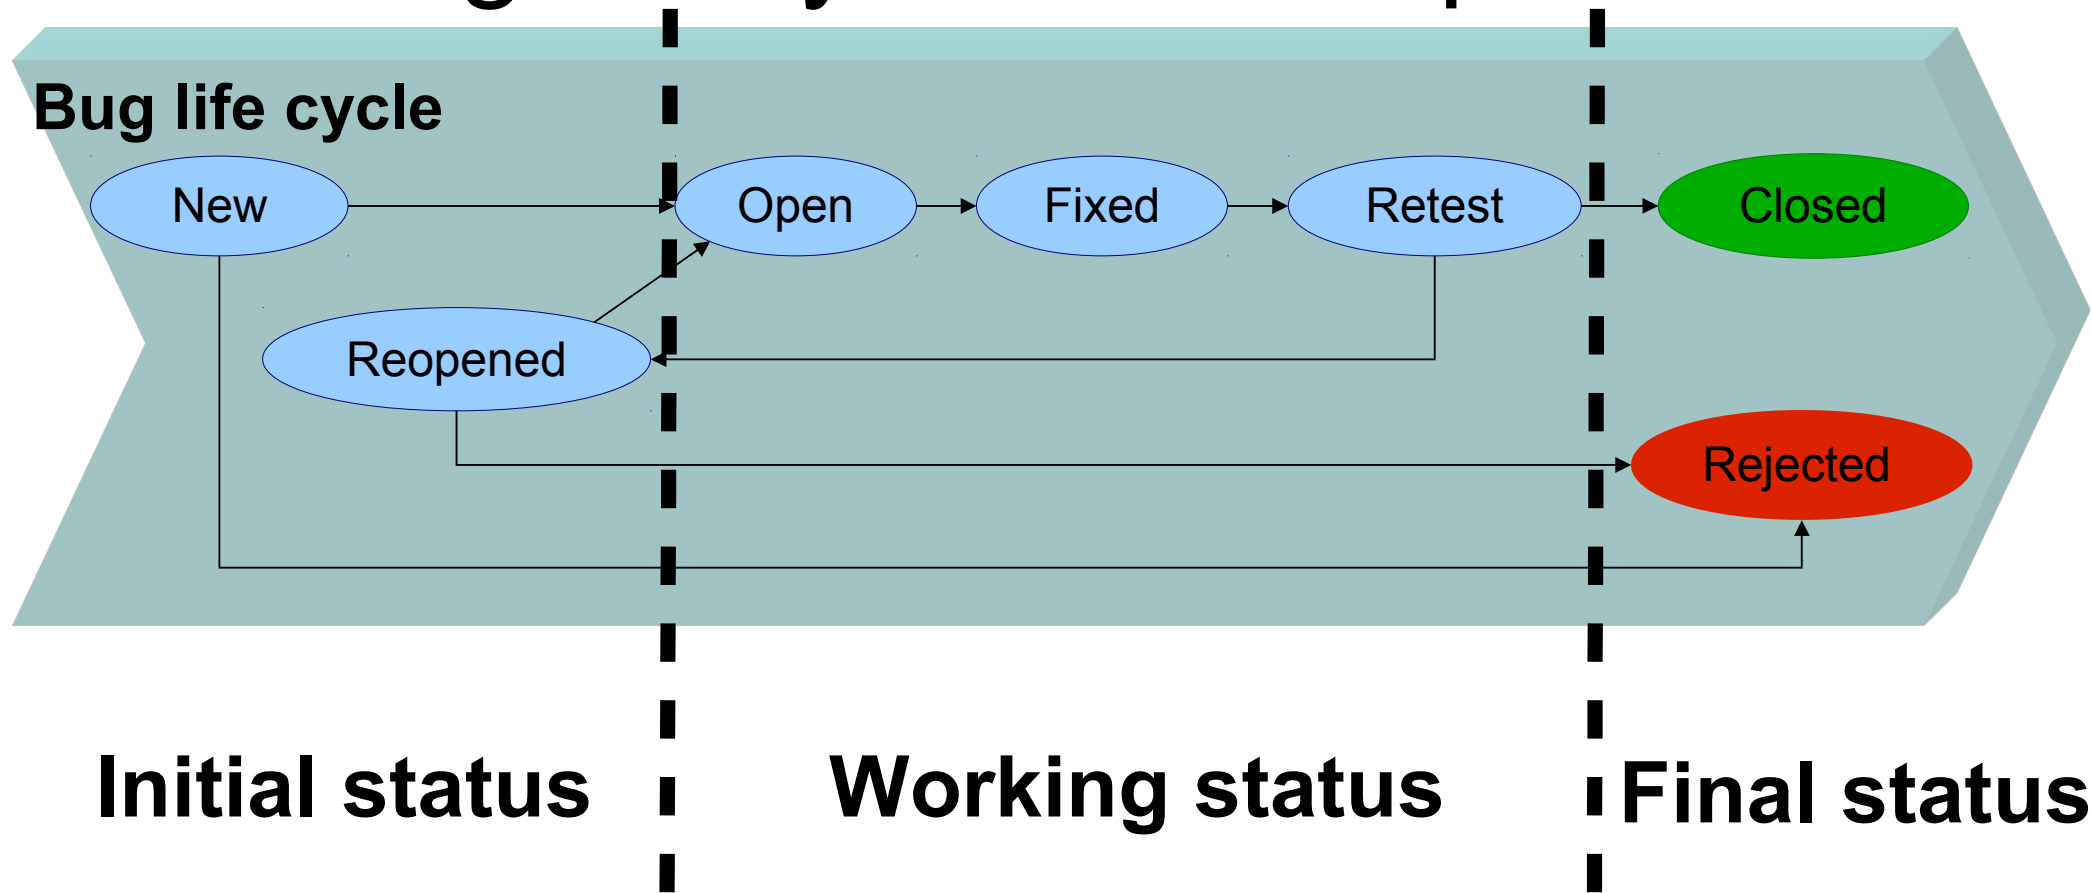

## Execution of test cases and bug life cycle

# Incident Management

## Bug life cycle – Example

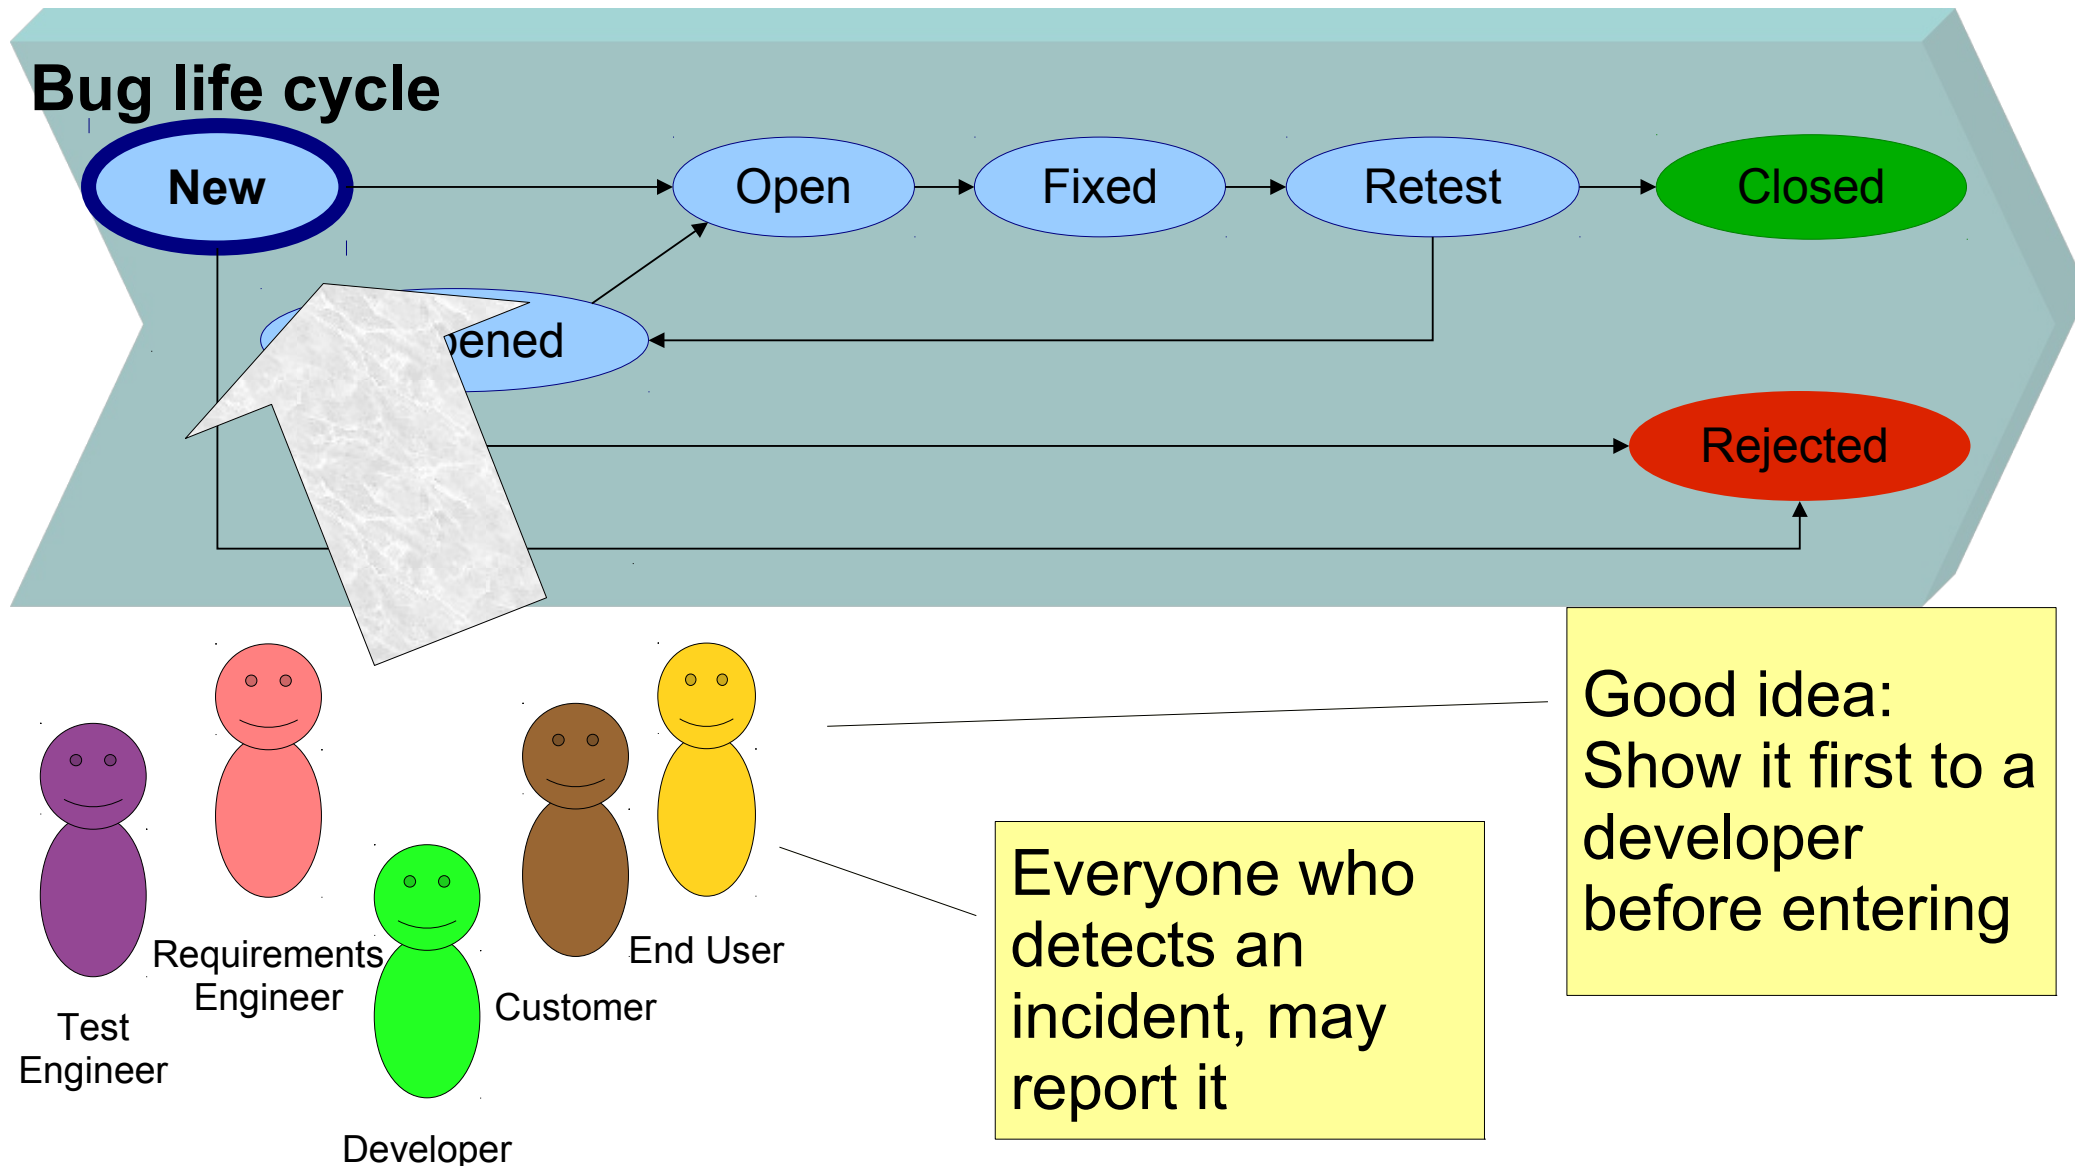

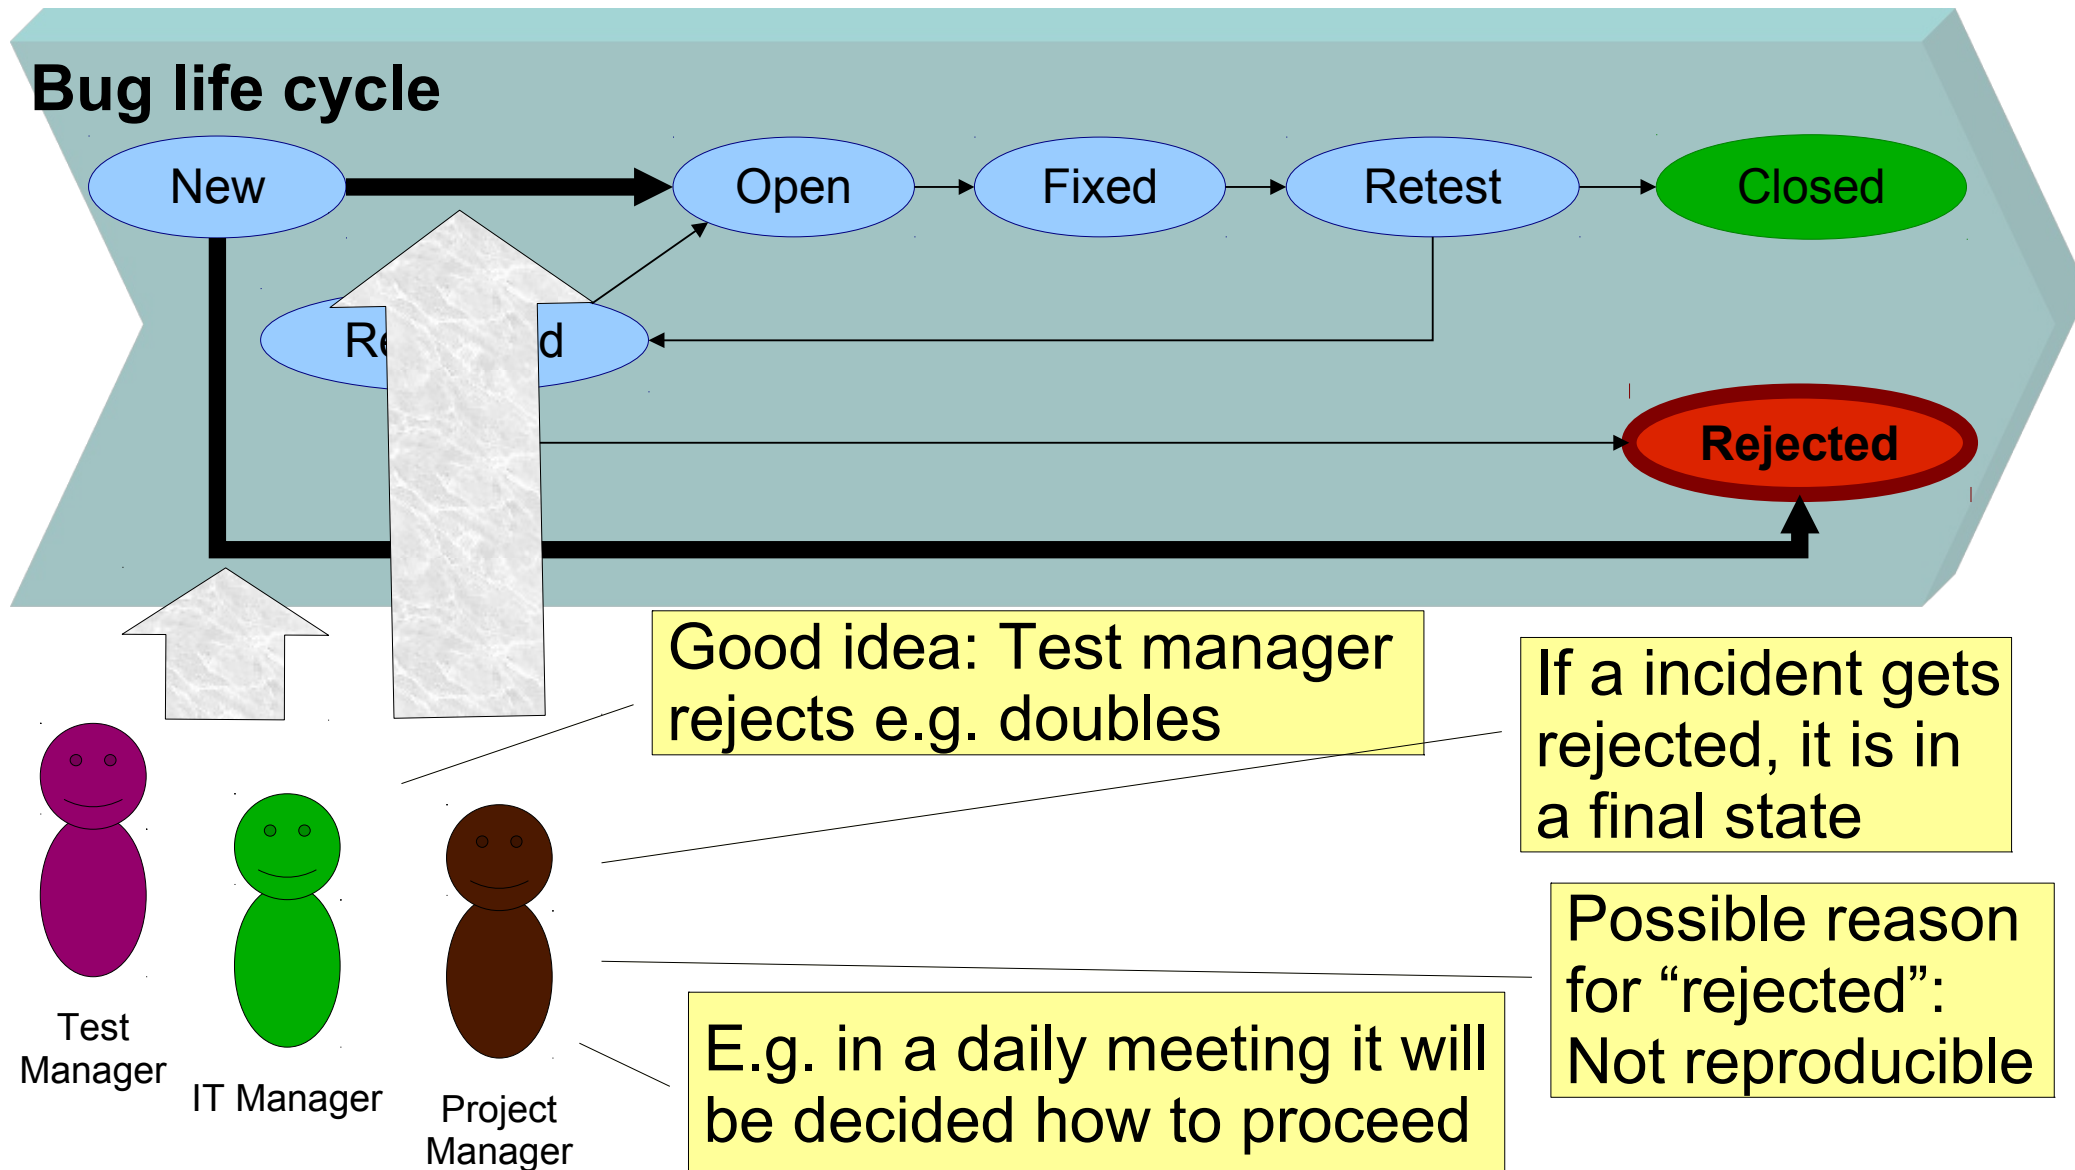

# Incident Management

## Bug life cycle – Example

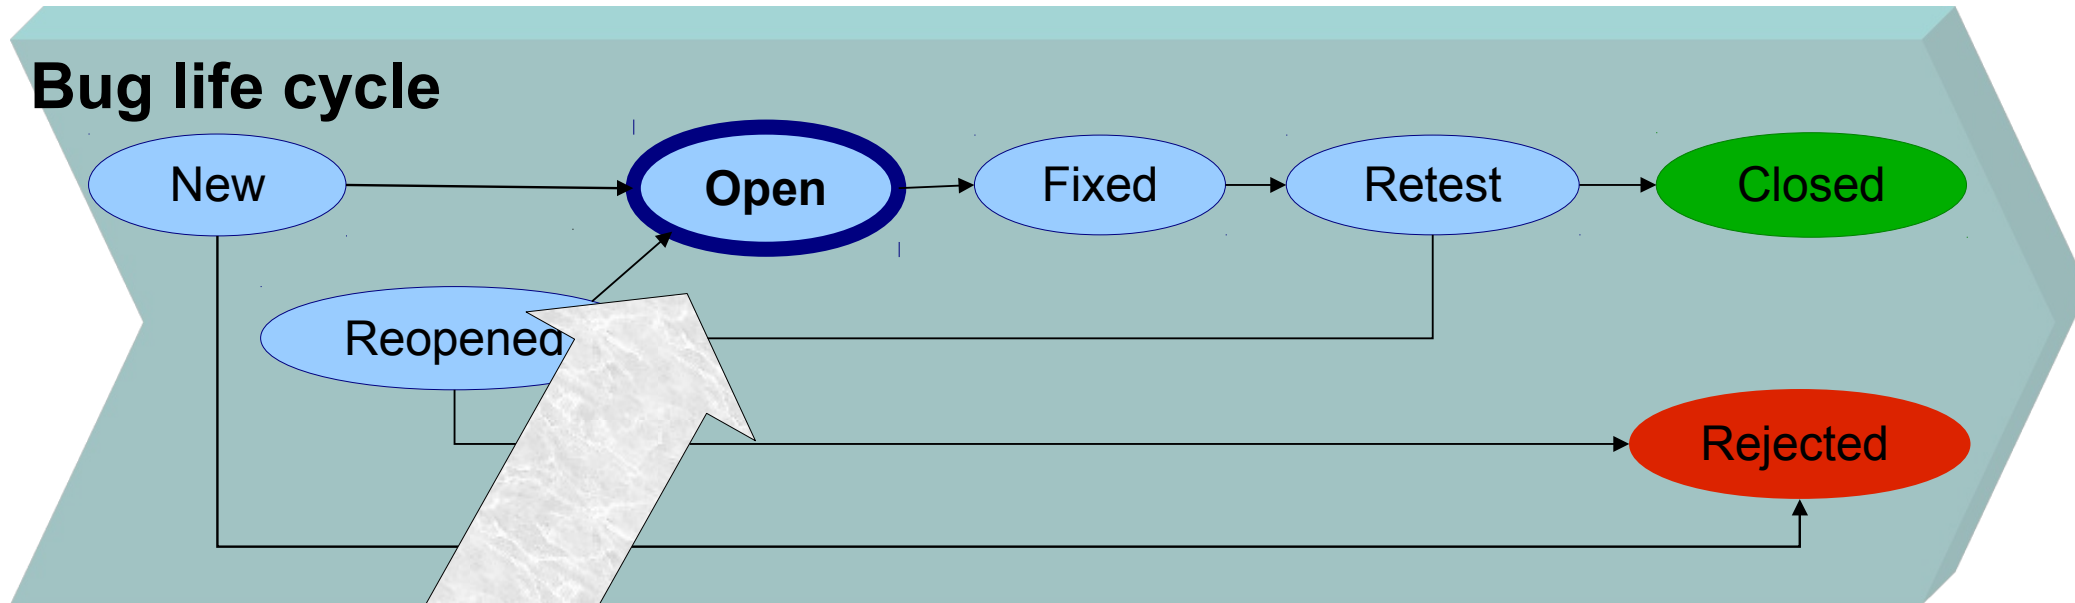

# Incident Management Bug life cycle – Example

# Incident Management

## Bug life cycle – Example

Depending on incident, e.g.:

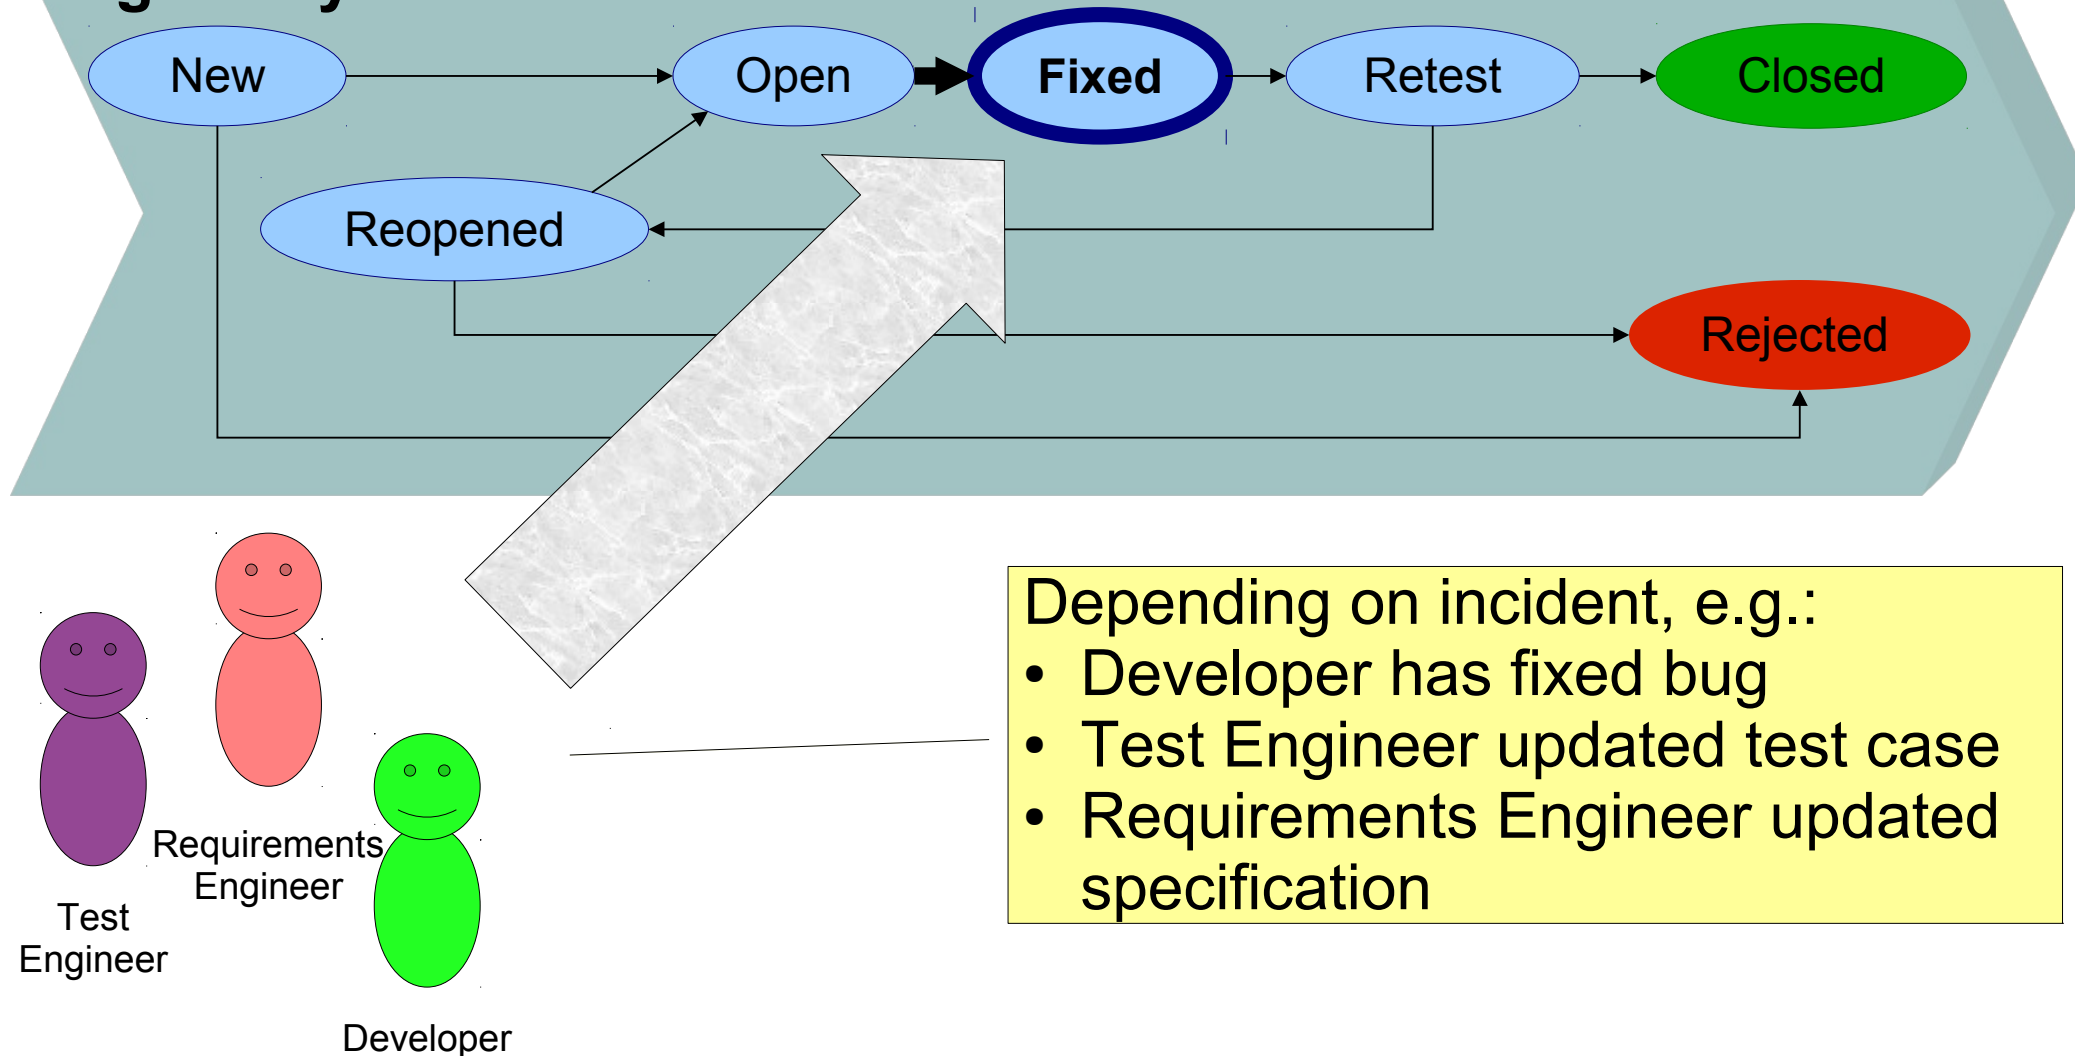

- Developer fixes
- Test Engineer updates test case
- Requirements Engineer updates specification

Good idea: Priority to control which defects got fixed first

# Incident Management

## Bug life cycle – Example

### Bug life cycle

Depending on incident, e.g.:

- Developer has fixed bug
- Test Engineer updated test case
- Requirements Engineer updated specification

# Incident Management

## Bug life cycle – Example

### Bug life cycle

Depending on incident, e.g.:

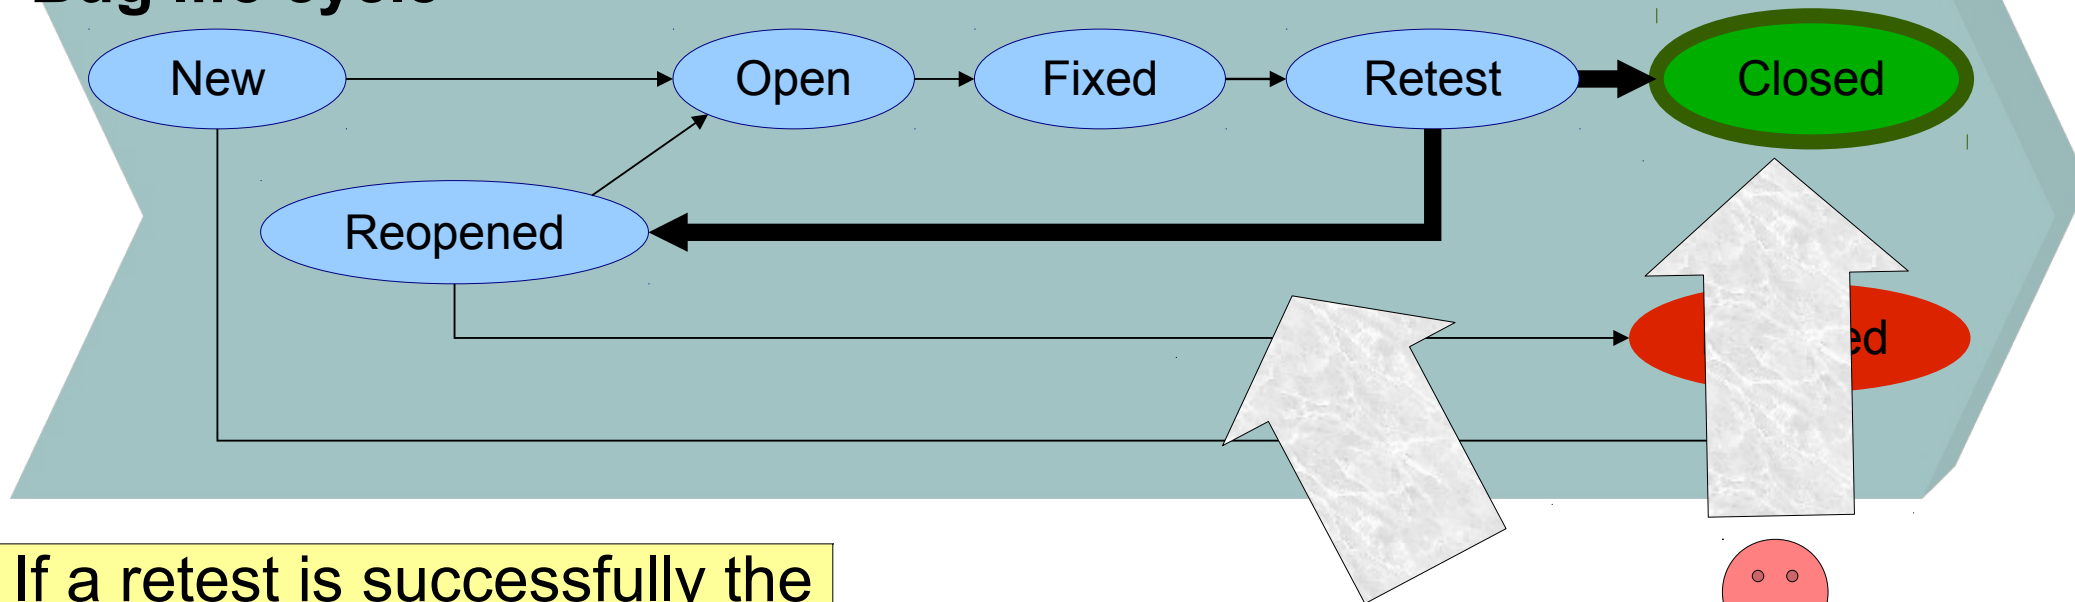

- Fix was delivered
  - Test case ready for review
  - Updated specification ready for review
- Retest typically done by Testers  
→ Who reports a defect, should retest!

# Incident Management

## Bug life cycle – Example

### Bug life cycle

If a retest is successfully the incident could get closed, otherwise it gets reopened.

**Rule:** Who opens an incident, is closing it as well

Closed is a final state

# Incident Management

## Bug life cycle – Example

### Bug life cycle

Test Manager

IT Manager

Project Manager

If a incident gets rejected, it is in a final state

“Reopened” typically handled like “new” incidents

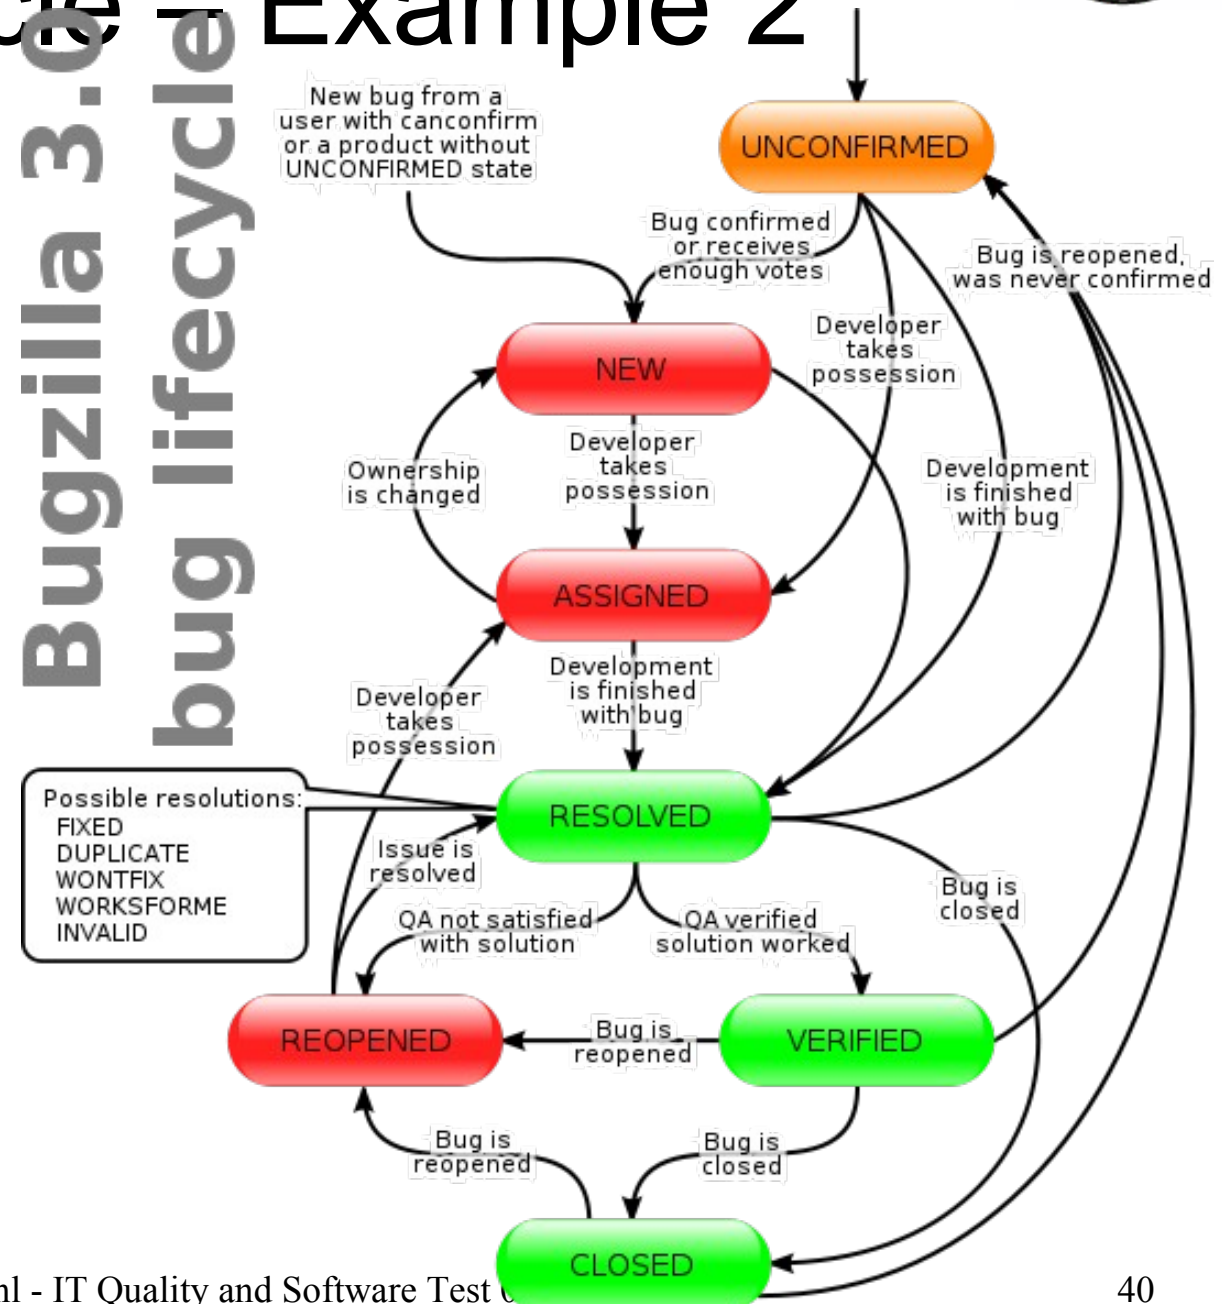

# Incident Management

## Bug life cycle - Example 2

- Example 2  
Bug life cycle  
of Bugzilla  
[Wik12a]

Bugzilla 3.0  
bug lifecycle

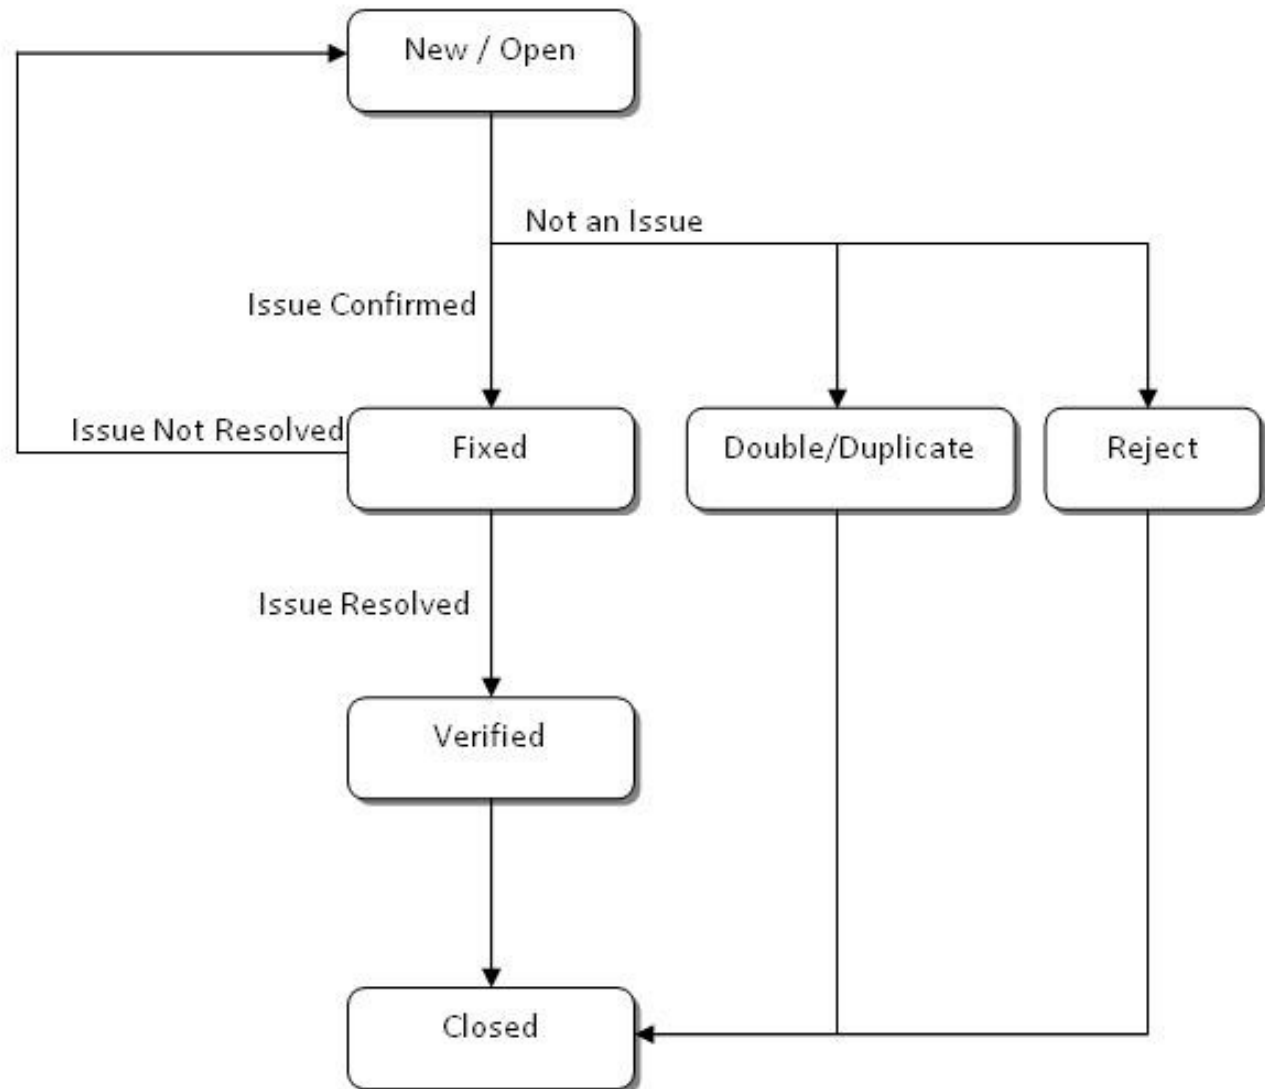

# Incident Management

## Bug life cycle – Example 3

- Example 3:  
Bug Life  
Cycle  
[QAT12]

Bug Life Cycle

# Incident Management Tasks (1/2)

- Daily communication
  - Discussion of new defects
  - Proceeding concerning special defects
    - Defects with high severity
    - Defects with no activities for certain time
- Coordination with tester, customers, and software vendor (developers)
  - Collection and administration of defects
  - Assigning of severity and priority levels
  - Clarification of responsibilities

# Incident Management Tasks (2/2)

- Monitoring of defect fixing
  - Monitoring releases:  
Which defects were fixed and delivered?
  - Organize re-testing
