3. Summary

Introduction

- The worst risks are the risks you don't know
- A simple risk management is often sufficient
... even better than no risk management
- Complex risk management is often required in
 - financial projects
 - health industry

Definitions

- ***Risk management:***

Exclusion, avoidance, or mitigation of project risks [DIN 69901-5:2009-01].

- Scope:

- Identification of risks
- Evaluation of risks
- Taking actions to mitigate risks

Objective of Risk Management

- Risks are depending on the context, e.g., software testing [ISTQB20G]
 - Differentiation between
 - **Product risk**:
A risk impacting the quality of a product.
 - **Project risk**:
A risk that impacts project success.
 - Resulting proceeding: Risk based testing: Testing in which the management, selection, prioritization, and use of testing activities and resources are based on corresponding risk types and risk levels.

Objective of Risk Management

- Project risks – examples
 - Organizational factors
 - Skill, training and staff shortages
 - Personnel issues
 - Political issues
 - Technical issues
 - Problems in defining the right requirements
 - Test environment not ready on time
 - Low quality of the design, code, configuration data, test data and tests
 - Supplier issues
 - Failure of a third party
 - Contractual issues

Objective of Risk Management

- Product risks – examples
 - The potential that the software / hardware could cause harm to an individual or company.
 - Software that does not perform its intended functions.
 - Poor software characteristics
Functionality, reliability, usability and performance.
 - Poor data integrity and quality
Data migration issues, data conversion problems, data transport problems, violation of data standards.
- Product risks are used to decide where to start testing and where to test more

Objective of Risk Management

- 1st goal: Avoiding project crisis and providing risks
- Basis: Project scenarios based on environmental analysis
 - Goal scenario
 - Best case
 - Worst case
- Planning activities and creating alternative project plans

Objective of Risk Management

- 2nd goal: Managing risks
- Keep in mind:
 - Most critical are the unknown risks! That's why:
 - Everyone must be able to inform about risks easily
- Handling risks: Activities to
 - decrease the probability of the incidence of the risk
 - reduce the estimated damage (impact) of the risk

Contents

1. Objective of Risk Management
2. Proceeding
3. Summary

Calculating Risks

- Proposal how to quantify risks

- Probability of incidence

P

- 3 = high
 - 2 = possible
 - 1 = low

- Impact on project if risk occurs

I

- 3 = very critical
 - 2 = critical
 - 1 = less critical

- Risk = Probability of incidence * Estimated impact = $P * I$

- Possible values:

- **9 and 6 = high risks**
 - **4 and 3 = medium risks**
 - **2 and 1 = low risks**

Calculating Risks

- Example

Risk description					Quantification			Mitigation	
Id	Risk identification	Potential cause	Contact person	Date	P	I	Risk = P*I	Status	Actions
1	Delay of delivery	Author sick	Uwe	27.02.	2	2	4	open	Regular swimming
2	Number of sold books low	Book unknown	Daud	03.04.	1	2	2	in progress	Advertisement

Abbr.		Explanation		Values			
Id		Identity					
Quantification:							
P		Probability of incidence		1 = low			
				2 = medium			
				3 = high			
I		Estimated impact		1 = less critical			
				2 = critical			
				3 = very critical			
Risk		= Probability of incidence *		1 or 2 = low risk			
		Estimated impact		3 or 4 = medium risk			
				6 or 9 = high risk			

Proceeding

- When should you do risk management?
 - Start as soon as possible
 - Repeat continuously, for example
 - once a month
 - regularly at the end of project meetings
- Hint: Top 10 risks
Focus on the top 10 highest risks

Contents

1. Objective of Risk Management
2. Proceeding
3. Summary

Summary

- Differentiate between product risks and project risks
- Risk $R = \text{probability } P * \text{estimated impact } I$
- Example for risk levels
 - high risk
 - medium risk
 - low risk
- Risk management activities
 - to minimize the likelihood of a product failure,
 - to mitigate the estimated impact,
 - should start with high risks.
